

Questions!

PAGERANK

ALGO!

→ Normalisation

$$X_{\text{new}} = \frac{X - X_{\text{min}}}{X_{\text{max}} - X_{\text{min}}}$$

→ Essentially it's citation based ranking

more backlinks
= more ↑

→ Prioritizing back-links [a site with more back links, it links to a site is more imp.]

Essentially we are clustering all the pages which are linked together and rank of pages with more backlinks is more imp. ↑ [and hence is to be ranked higher]

Ex 1 is also visualised as random probability that a random surfer might jump away from the cluster of sites! To other random site

→ A in eqⁿ In the paper

$$\|E\| = 0.15$$

⇒ Basically replace E with a 0-1 vector on basis of user preference.

↓
or probability vector!

Paper uses bookmarks as a relevant preference labels

! Don't agree with commercial interest pt.

Applications of web traffic analysis

Backlink prediction

[As expected] Predictive & personalised search!

Next STEPS!

→ Read random theory book snippets.
